SuDu Ai

SUDU AI · OPERATION SYSTEM: PRODUCTION

SuDu MES

Production management

From production order to finished goods in the warehouse, on web and mobile app.

WHY SUDU MES

What SuDu MES solves

PROBLEM 1

Where is my order?

- Scan the work tag at each step
- See live progress per order

PROBLEM 2

Material over-used

- Issue material by BOM
- Wastage % calculated per order

PROBLEM 3

Paper logsheets

- Report good and reject qty on the app
- No re-keying at the office

PROBLEM 4

FG not in the books

- FG receipt goes straight into WMS stock
- Batch traceable to the order

WHERE IT FITS

Plan, make, store: three jobs, one system

WHAT

Sales & planning

- Sales Order or reorder
- decides what to make

HOW

SuDu MES

- Production order, route, BOM
- controls how it is made

WHERE

SuDu WMS

- Issues materials
- stores finished goods

Same stock, same items. MES uses WMS stock and SQL Accounting master data, so there is no double entry between factory, store and accounts.

HOW IT WORKS

From demand to finished goods

PLAN & PREPARE

Demand
SO or reorder

→

Production order
MTO or MTS

→

Route & BOM
version chosen

→

Material request
optional

→

Material issue
from WMS

→

Material receive
at the line

PRODUCE & CLOSE

Production reporting
good · reject

→

FG receipt
against order

→

QC
optional

→

Into WMS stock
by batch

→

Usage & wastage
vs BOM

Planner on web | Operator on mobile app | Warehouse on WMS

PLAN

Orders, process routes and BOM

Production order

- Make to order (linked to SO) or make to stock
- Status: Issued → In progress → Partially completed → Completed
- On hold or cancelled when needed

Process route

- Ordered steps for each finished good
- Route A and route B as alternatives
- e.g. a different machine line

Multi-level BOM

- Main material → sub material → sub components
- Version 1, version 2
- Version chosen on the order

MATERIALS

Issue by BOM, see the wastage

STANDARD ISSUE

Production order
planned qty

→

BOM requirement
standard qty

→

Material issued
from warehouse

→

Less FG output?
than expected

→

Wastage %
calculated

EXTRA MATERIAL

Production asks
for more

→

Additional request
approved

→

Additional issue
from warehouse

→

Additional usage
recorded on order

Unused material is **returned to stock**. Every issue and return shows on the stock card, from warehouse to production and back.

EXECUTE

Run the shop floor from the phone

PRINT

Work tag (QR)

- Printed per order
- Customer, SO no., qty, steps
- Travels with the job

SCAN

Scan & report

- Start / end by machine
- Total, good and reject per step
- Who, which machine, what time

CLOSE

Check & receive

- Post-production QC
- FG receipt into WMS by batch
- Passed goods ready to sell

Planned vs actual vs defect by machine, shift and operator, from the same scans.

YOUR FLOW, YOUR SETTINGS

Set MES to how your factory runs

Setting	Choose one (or more)
Production type	Make to order · Make to stock · Both
Material request	On (request → issue) · Off (issue directly by BOM)
Reporting	Every process step · Final output only
QC after production	On · Off
Wastage tracking	On (wastage % and additional usage) · Off
Scope	MES Standard: assembly, BOM, issue, FG receipt · Full MES

INTEGRATION

Linked to sales, warehouse and SQL

Sales Order

- Make-to-order jobs keep the SO link
- Sales sees production status

Reorder

- FG below minimum
- creates a make-to-stock order

SuDu WMS

- Material issue and return
- FG receipt into bins, by batch

SQL Accounting

- Items synced from SQL
- Stock movements posted

GETTING STARTED

Go live in four steps

1

Assess

Products, lines, current paperwork

2

Model

BOM, routes, machines, work tags

3

Pilot one line

Train operators, test the flow

4

Scale

All lines, full reporting

Start with your best-known product on one line. Prove the counts, then roll out.

SUDU MES

Every job. Every material. Fully in control.

Production orders, material issue, shop-floor reporting and FG receipt, linked to WMS and SQL Accounting.
